#87600 AS 1172.1:2005, WELS 3 Star

instructions

Rear water inlet requires 1/2" BSP female flush with finished wall:

To mount the pan to finished floor one of two methods should be used.

1. Screw/bracket fixing: the pan is fixed directly to the finished floor using mounting brackets and screws supplied. A bed of silicone sealant should be used to correctly seal the pan onto the floor.
2. Bedding on sand & cement mix: the pan should be fixed to the floor using a mixture of 3:1. When bedded, the base of the pan should be approximately 10mm above the finished floor level.

Please note: all height dimensions are taken from base of the toilet pan, so an allowance for bedding thickness is required.

Do not use: lime, white cement or fast drying cement. These may crack the base of the pan.
